Experience

Trellis (Y Combinator, Spring 2026) — Feb 2026 – Present
Founding Lead Engineer — San Francisco, CA (Remote)

AI agents that run guest messaging and daily operations for vacation-rental managers.

- **Built the product from day one** with the founding team, from first commit to 45+ property-management customers, 4,000+ listings and $600K+ ARR in 9 months.
- **Set up the codebase the whole team builds on**: one Turborepo monorepo for the web app, API and mobile app, with the shared Postgres schema, database migrations and CI/CD to Vercel and Fly.io.
- **Shipped the direct Airbnb integration** on Airbnb's official API (listings, pricing, calendar, messaging, bookings, payouts, claims), so operators can run Airbnb from Trellis without a property-management system (PMS).
- **Fixed a peak-traffic production slowdown**: cut API p95 latency by 74% (5.5 s → 1.4 s) and auth-server calls by 98% by verifying sessions locally, moving the API, jobs and Redis next to the database, and fixing slow queries and deadlocks.
- **Cut ∼$13K/month in AI and cloud spend** by moving high-volume LLM classification to cheaper models, lowering reasoning effort and removing duplicate calls; built per-feature AI cost tracking and a cross-vendor cost dashboard.
- **Led development of the AI Inbox**, the core product where AI agents and staff answer guests on every channel, adding LINE, Instagram, Messenger, WhatsApp groups, Booking.com and Vrbo chats, and WhatsApp Business calling.
- **Integrated the systems operators run on**: PMS and channel managers (Guesty, Hostaway, Cloudbeds, Channex, Kross), smart locks and sensors (Seam, RemoteLock, Minut) and Stripe payments in the Guest Portal.
- **Developed the workflow engine's core actions**, turning operators' written procedures into AI-run automations (escalations, visits, shifts, reports) with Slack, Attio, monday.com, Breezeway and PriceLabs.
- **Worked directly with 20+ customers** on Slack and WhatsApp, turning their reports into fixes and features.

Wikicasa.it — 2023 – 2026
Backend Developer, Part-Time — Genoa, Italy (Hybrid)

- Built a Go/gRPC image-processing service for 270M images (25 TB), cutting cloud storage costs by 40%.
- Built "TroverAI", a RAG-based natural-language property search, with Python, LangChain and the OpenAI API.
- Set up the company's first Kubernetes cluster on bare-metal servers, with CI/CD on Bitbucket and ArgoCD.
- Sped up geospatial polygon lookups 12× (∼160 ms → ∼13 ms) with a dedicated microservice.
- Cut the time to load agency data from MySQL into Elasticsearch by 83%; migrated MongoDB queries to Elasticsearch.
- Reduced application startup time by 45 s by fixing cache inefficiencies with a cache-serialization layer.

Ikinova — 2022 – 2023
Full-Stack Developer, Part-Time — Acqui Terme, Italy (Remote)

- Migrated the backend from PHP to TypeScript/Node.js; built CI/CD from scratch (Mocha, GitHub Actions).
- Wrote a daemon that syncs patient data from the Piedmont Region's API; built Ionic/Angular UI components.

Skills

Languages	TypeScript, Python, Go, SQL
Backend & data	Node.js, Next.js, PostgreSQL/Supabase, Prisma, Redis, Elasticsearch, MongoDB, MySQL, gRPC
AI	OpenAI/Gemini APIs, Vercel AI SDK, OpenAI Agents SDK, RAG, LangChain, Claude Code, Codex
Cloud & DevOps	Vercel, Fly.io, Google Cloud, Kubernetes, ArgoCD, Docker, GitHub Actions, Sentry, PostHog
Frontend & mobile	React, React Native (Expo), Angular, Ionic
Integrations	Airbnb API, WhatsApp Business and Meta APIs, Twilio, Stripe, Seam

Education

University of Genoa — 2022 – 2025
B.Sc. in Computer Science, IANUA honors program (top 10% of students) — Genoa, Italy

Projects

University ChatBot — 2024
Google × IANUA

- Built a Gemini RAG chatbot answering student questions from university web pages (team of 4; Next.js, Python).

Awards & Programs

Samsung Innovation Campus: IoT and innovation specialization course — 2023
Kangourou: national finalist in Italy's math and programming competition — 2022
LeadTheFuture: selected mentee of the STEM mentorship non-profit (<20% acceptance rate) — 2022
